

SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

1. IDEATION PHASE

1.1 PROJECT IDEA

The project focuses on implementing a Script-Controlled Access Control List (ACL) in ServiceNow to restrict access to records based on specific conditions.

The system allows users to access records according to their assigned roles and the value of the Branch field. In this project, users belonging to the EEE branch are allowed to view EEE branch records, while administrators have full access.

1.2 PROBLEM STATEMENT

In an organization, all users should not have access to every record. Unauthorized users may view or modify sensitive records if proper access control is not implemented.

Therefore, a mechanism is required to control record access based on user roles and field values.

1.3 PROPOSED SOLUTION

The proposed solution is to use Script-Controlled ACLs in ServiceNow.

The ACL checks the user's role and the Branch field value before allowing access to the records. Different ACLs are created to control Read, Create, Write, and Delete operations.

1.4 PROJECT OBJECTIVE

The main objectives of the project are:

To restrict unauthorized access to records.

To provide access based on user roles.

To control record access based on the Branch field.

To implement Read, Create, Write, and Delete ACLs.

To provide administrators with full access to the records.

1.5 EXPECTED OUTCOME

The expected outcome is a secure ServiceNow system where record access is controlled using user roles and field values. Unauthorized users are prevented from accessing restricted records, while administrators retain full access.
